Assessment #2 - Part I - Results

Attempt 1 of 1

Written Mar 28, 2024 11:45 AM - Mar 28, 2024 12:30 PM

Attempt Feedback

Assessment #2 Grade: B+

Current Grade: B+

Attempt Score **24 / 32 - 75 %**
Overall Grade (Highest Attempt) **24 / 32 - 75 %**

Question 1

2 / 2 points

Consider the following arrays...

```csharp
string[] sports = {"Baseball", "Soccer", "Football", "Basketball", "Hockey"};
int[] avgAttendance= {20000, 44000, 75000, 18000, 14000};
```

Which segment of code will always display the average attendance of a chosen sport in a Message Box taken from a TextBox value called txtSportName?

✓ ●

```csharp
string s = txtSportName.Text;
int x = Array.IndexOf( sports, s );
if( x != -1 )
  MessageBox.Show( avgAttendance[x] );
else
  MessageBox.Show( "Sport not found." );
```

○

```csharp
string s = txtSportName;
int x = Array.IndexOf( sports, s );
if( x == -1 )
  MessageBox.Show( avgAttendance[x] );
else
  MessageBox.Show( "Sport not found." );
```

○

```csharp
string s = txtSportName.Text;
int x = Array.IndexOf( sports, s );
if( x == -1 )
  MessageBox.Show( avgAttendance[x - 1] );
else
  MessageBox.Show( "Sport not found." );
```

○

```csharp
string s = txtSportName.Text;
int x = Array.IndexOf( s, sports );
if( x == -1 )
  MessageBox.Show( "Sport not found." );
else
  MessageBox.Show( avgAttendance[x] );
```

Question 2

1 / 2 points

The following is a sample of the order data (Customer#, Order#, OrderQty, UnitPrice) stored in a text file named Orders.txt:

0155, 76533, 3, 10.95
0140, 75446, 12, 8.50
0150, 75550, 1, 89.95
0145, 75648, 25, 2.50

Consider the following code that reads data from the above file:

```csharp
StreamReader OrdersReader = new StreamReader("Orders.txt");
string[] fields;
while (OrdersReader.EndOfStream == false)
{
        currentLine = OrdersReader.ReadLine();
        fields = currentLine.Split(',');
}
lstDisplay.Items.Add(fields[2]);
```

What would be the output displayed in the list box, lstDisplay?

Answer: 3 12 1 25 ✗ (25)

Question 3

1 / 1 point

What would be the value displayed in the ListBox?

```csharp
string[] weekDay = {"Sun", "Mon", "Tue", "Wed", "Thu", "Fri", "Sat"};
string[] DaysOfWeek = weekDay;
weekDay[1] = "Monday";
lstDisplay.Items.Add(DaysOfWeek[1]);
```

Answer: Monday ✓

Question 4

6 / 6 points

The following is a sample of the order data (Customer#, Order#, OrderQty, UnitPrice) stored in a text file named Orders.txt:

0155, 76533, 3, 10.95
0140, 75446, 12, 8.50
0150, 75550, 1, 89.95
0145, 75648, 25, 2.50

Consider the following code that reads data from the above file:

```csharp
StreamReader OrdersReader = new StreamReader("Orders.txt");
string[] fields;
while (OrdersReader.EndOfStream == false)
{
        currentLine = OrdersReader.ReadLine();
        fields = currentLine.Split(',');
}
```

Rewrite the code above so that the program stores the average unit price of the items in Orders.txt.

```
StreamReader OrdersReader = new StreamReader("Orders.txt");
string [] fields
int totalQuantity = 0;
decimal totalPrice = 0;

while(OrdersReader.EndOfStream == false)
{
currentLine= Orders Reader.ReadLine();
fields = currentLine.Split(',');

// to get my prices from the correct field
double unitPrice = Convert.ToDouble(fields[3]);

totalUnitPrice += unitPrice;
numItems++
}

//Get Average
double averageUnitPrice = totalUnitPrice / numItems;
```

The correct answer is not displayed for Written Response type questions.

Question 5

3 / 3 points

Explain what this line of code does.

```csharp
Array.Resize(ref names, names.Length + increment);
```

The array is resized to the length of the referenced name during the runtime of the program.

The correct answer is not displayed for Written Response type questions.

Question 6

2 / 2 points

Consider the following code that uses a ListBox named lstDisplay to display an element of an array:

```csharp
string[] weekDay = { "Sun", "Mon", "Tue", "Wed", "Thu", "Fri", "Sat" };
string[] DaysOfWeek = new string[7];
for (int index = 0; index <= 6; index = index + 1)
        DaysOfWeek[index] = weekDay[index];
weekDay[1] = "Monday";
lstTopMonths.Items.Add(DaysOfWeek[1]);
```

What would be the value displayed in the ListBox?

Answer: Mon ✓

Question 7

3 / 6 points

The following is a sample of the order data (Customer#, Order#, OrderQty, UnitPrice) stored in a text file named Orders.txt:

0155, 76533, 3, 10.95
0140, 75446, 12, 8.50
0150, 75550, 1, 89.95
0145, 75648, 25, 2.50

Consider the following code that reads data from the above file:

```csharp
StreamReader OrdersReader = new StreamReader("Orders.txt");
string[] fields;
while (OrdersReader.EndOfStream == false)
{
        currentLine = OrdersReader.ReadLine();
        fields = currentLine.Split(',');
}
```

Consider the following **changes** to the code above...

fields = currentLine.Split('5');

1. After the while loop is executed, write a foreach loop that sends all elements of fields to a ListBox called lstBox.
2. Write the output sent to the ListBox after the code is executed.

```
StreamReader OrderReader = new StreamReader("Order.txt");
string[] fields;
while (OrdersReader.EndOfStream == false)

{
currentLine = Orders Reader.ReadLine();
fields = currentLine.Split(',');

foreach (string elements in fields)
{
Listbox.Items.Add(elements);
}
}
```

The correct answer is not displayed for Written Response type questions.

Question 8

0 / 2 points

Consider the array below.

```csharp
string[] weekDay = {"Sun", "Mon", "Tue", "Wed", "Thu", "Fri", "Sat"};
```

Which of the following successfully copies a part of the array above into a new array called workDay?

○ string[] workDay = new string [5];

Array.Copy(weekDay, 0, workDay, 0, 7);

⇨ ○ string[] workDay = new string [5];

Array.Copy(weekDay, 1, workDay, 0, 5);

○ string[] workDay = new string [7];

Array.Copy(weekDay, 0, workDay, 1, 5);

○ string[] workDay = new string [7];

Array.Copy(weekDay, 1, workDay, 1, 5);

✗ ● string[] workDay = new string [5];

Array.Copy(weekDay, 0, workDay, 1, 5);

Question 9

4 / 6 points

The following is a sample of the order data (Customer#, Order#, Order Qty, Unit Price) stored in a text file named Orders.txt.

0155, 76533, 3, 10.95
0140, 75446, 12, 8.50
0150, 75550, 1, 89.95
0145, 75648, 25, 2.50

Consider the following code:

```csharp
StreamReader OrdersReader = new StreamReader("Orders.txt");
string currentLine;
string[] fields;
float extendedCost;
int index = 0;
string[] orderNumbers = new string[10];
float[] costs = new float[10];

while( ! OrdersReader.EndOfStream )
{
  currentLine = OrdersReader.ReadLine();
  fields = currentLine.Split(',');
  //YOUR CODE HERE
  index++;
}
```

Add code that...

- Computes and store the extended cost in the local variable called extendedCost.
- Stores each order # in the array orderNumbers
- Stores each extendedCost in array costs

```
StreamReader OrdersReader = new StreamReader("Orders.txt");
string currentLine;
string[] fields;
float extendedCost;
int index = 0;
string[] orderNumbers = new string[10];
float[] costs = new float[10];

while( ! OrdersReader.EndOfStream )
{
 currentLine = OrdersReader.ReadLine();
 fields = currentLine.Split(',');

extendcost = int.Parse(fields[2]) * float.Parse(fileds[3]);

orderNumbers[index] = fields[1];

costs[index] = extendedcost;

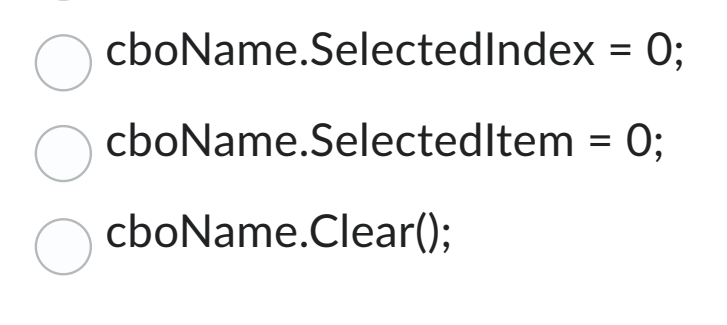
 index++;
}
```

The correct answer is not displayed for Written Response type questions.

Question 10

2 / 2 points

A comboBox, cboNames, shown below, is used to display a set of student names, and let the user select a name.



In order to reset the above ComboBox so that no student is selected, the appropriate statement would be:

✓ ● cboName.SelectedIndex = -1;
○ cboName.SelectedItem = -1;
○ cboName.SelectedIndex = 0;
○ cboName.SelectedItem = 0;
○ cboName.Clear();

Done
